

UV Protection Is Important All Year Long Through All Types Of Weather.

Did you know that spending a day in the snow can be harder on your patient's eyes than a day at the beach? Snow reflects nearly 80 percent of the sun's rays. That means more harmful UV and HEV (High Energy Visible Light) rays are directed into your patient's eyes. Winter or summer, these rays damage eyes just like your skin. Make sure your patients have protection from the FRONT and the BACK of their lenses. Zero Glare plus UV provides just that.

Zero Glare plus UV can also help prevent Cataracts, Pinguecula, Ptergium and Macular Degeneration diseases.

Don't forget that kids need protection too! A significant amount of sun exposure occurs by age 18, making early eye protection critical. With larger pupils and clearer lenses, children are particularly vulnerable to UV exposure, receiving three times the annual UV dose as adults. They spend more time outdoors and have increased exposure to reflective surfaces such as sand, pavement, water and snow, children's risk of UV damage is intensified.

Zero Glare plus UV is available at P.O.G, Call our Sales Representatives for pricing information. It includes AR and UV protection with a 2 year warranty.
